Producing recombinant domains of the human muscle nicotinic acetylcholine receptor (AChR) for treating myasthenia gravis, which contains the major part of the extracellular domain of the AChR receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated human matrix metalloprotease gene - used to develop products for the diagnosis, prevention and treatment of e.g. cancer, arthritis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MMP19; matrix metalloprotease 19; human; cancer; arthritis; inflammation; therapy; diagnosis; PCR primer; ss.
                                                                                                                                                       The present invention relates to producing of a group of recombinant domains of the human muscle nicotinic acetylcholine receptor (AChR) subunits alpha, beta, gamma, delta and epsilon, or the mutant forms of the molecules, or the alpha domain containing the P3A exon, which contains the major part of the extracellular domain of the receptor. The method is useful for producing recombinant domains of the human muscle nicotinic AChR for the immunoadsorption of anti-AChR antibodies in myasthenia gravis patients. The permanently immobilized molecules can be used alther separately or in combination for therapeutic in vitro or exvivo elimination/apheresis of the majority of the anti-AChR antibodies from the blood or sera of MG patients. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Kostelidou

The sequence represents a PCR primer used in the invention to amplify DNA encoding the clone 907334 matrix metalloprotease protein (MMP-ABT) from a plasmid. The invention relates to a novel polynucleotide, which comprises a nucleotide sequence encoding a human matrix metalloprotease protein (designated MMP-ABT). The protein of the invention has cytostatic, anti-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein, useful for diagnosing, inflammatory diseases (e.g. for treating these diseases.
                                   This sequence represents a PCR primer for the human matrix metalloprotease 19 (MMP19) coding sequence of the invention. The DNA, protein, and antibodies against MMP19 can be used in the diagnosis, prognosis, prevention or treatment of individuals with conditions associated with the expression of the MMP19 gene, such as cancer, arthritis or inflammation, or to identify a predisposition to these conditions. The DNA can be fixed to a substrate and used to detect the presence of MMP19 in a sample. The sequences can be used to make primers for use in reverse transcription PCR to detect MMP19, they can also be used to identify inhibitors of MMP19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human matrix metalloprotease protein MMP-ABT EST upstream PCR primer #2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; MMP-ABT; matrix metalloprotease; cytostatic; anti-inflammatory; anti-arthritic; gene therapy; cancer; inflammatory disease; arthritis; EST; expressed sequence tag; PCR; primer; ss.

Determining open reading frames of genome of an organism e.g. a human suffering from cancer involves use of single oligonucleotide primer at low stringency for preparing single-stranded cDNA from mRNA of individual.

Example 9; Page 543; 959pp; English.

The invention describes a method of determining open reading frames in the genome of organism, comprising contacting mRNA from cell of organism with a single oligonucleotide primer (I) at low stringency, preparing single-stranded cDNA by reverse transcribing mRNA with (I), amplifying cDNA, sequencing the product, and repeating the contacting, preparing and amplifying steps with different primers and sequencing resulting nucleic acids. The method is useful for: determining that a known nucleotide sequence from a genome of an organism corresponds to a

conclectide sequence of an open reading frame; for preparing a contig,

nucleic acid molecule from a genome of an organism; and for sequencing

con lor part of a genome of an organism. mRNA is obtained from meammalian

or human cell which is associated with a pathological condition e.g. a

colon cancer or breast cancer cell. The method is useful for analyses of

colon cancer or breast cancer cell. The method is useful for analyses of

colon cancer or breast cancer cell. The method is useful for analyses of

large or small populations. further, it can be used to study living

systems to determine if, e.g. there have been genetic shifts which render

conjenited diseases, and the risk of affliction to a foetus, as well as

to engenited diseases, and the risk of affliction to a foetus, as well as

the study of whether the conditions are likely to be passed to offspring

through ova or sperm. The analyses for pathological conditions can be

congenited dout in all animals, plants, birds, fish, etc. Using this method,

in the area of agriculture, for example the genomes of food crops can be

cudied to determine if resistance genes are present, defects in plant

condensation of the pathogens which integrate into the genome, such as

retroviruses and other integrating viruses such as influenza virus, have

cudergone shifts or mutations, which may require different approaches to

therapy. This method is also applied to eukaryotic pathogens; such as

crypanosomes, different types of lasmodium, etc. The method essentially

continues sequencing of non-coding portions. This leaves represents a

coliminates sequencing of non-coding portions. This leaves the sequence represents a polynucleotide isolated from human colon cancer cell cDNA library

Claim 1; SEQ ID NO 2137; 71pp + Sequence Listing; English.

The present sequence is one of a large number of 5' ESTB derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTB were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTB are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTB are derived from mRNAs with inteact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTB are also used to obtain full length upstream regulatory sequences and to design expression and secretion rectors

Six hundred and twenty five polynucleotides derived from a variety of

The invention relates to 625 polynucleotides which have been derived from a variety of human tissue sources and which encode novel secreted a variety of human tissue sources and which encode novel secreted corrected that complements and sequences that hybridise to them. Also included are a vector comprising the polynucleotide, a host cell cransformed with the vector, the proteins encoded by the polynucleotides, antibodies that bind to the proteins and identification of modulators of the proteins or the expression of the polynucleotide. The polynucleotides can be used as probes for the identification and isolation of full length con be used as probes for the identification and isolation of full length con a nutritional supplements. The protein is useful in the treatment of various immune deficiencies and gloorders such as viral infections, bacterial infections, fungal infections, autoimmune thyroiditis and chabetes) and allection reactions and conditions (e.g. asthma). They are also useful for treating neurodegenerative diseases (e.g. Alzheimer's classouseful for treatment of burns, inclaions and ulcers. The proteins are also useful for regulating haematopoiesis, for treating myeloid or lapponed the form of the conditions of the foll deficiencies. The present sequence is one of the 625 cDNA conditions and ulcers. The present sequence is one of the 625 cDNA conditions. human tissue sources which encode secreted proteins, useful for treating immune deficiencies and disorders such as autoimmune disorders. Claim 1; Page 70; 339pp; English.

                                                                                                                                                      The invention relates to an antibody immunospecifically binds to peacherin or its fragment. The antibody is useful in preparing a composition for treating or preventing a cancer-associated disorder. The present sequence represents a gene downregulated in human colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antibody immunospecifically binds to p-cadherin or its fragment. The antibody is useful in preparing a composition for treating or preventing a cancer-associated disorder. The present sequence represents a gene downregulated in human colon cancer
New antibody that immunospecifically binds to p-cadherin, useful in preparing a composition for treating or preventing a cancer-associated disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antibody that immunospecifically binds to p-cadherin, useful in preparing a composition for treating or preventing a cancer-associated disorder.
                                                                                                                                                                                                                           Human colon tumor cell downregulated gene SEQ ID NO 2936

The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polyneptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences or enseit in adagnostics as expressed sequence tags (EST) for information in assessing biodiversities, or in identifying mutations in forensics, in assessing biodiversities, or in identifying mutations in cresponsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCK, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense bnA or RNA. The purified polypeptide is useful for generating antibodies specific for it. The present sequence is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data contains a part of the printed specification, but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating

The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 954 identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data of a strenges to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.

The present invention describes a method (M1) for screening for an antinopplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gne (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in AbL61664 to AbL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomed, luny, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; SEQ ID NO 1016; 44pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tunmour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93603-ABN97455 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a patient, involves detecting the level of expression of two or more genes in a liver tissue sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gene, liver cancer; ds; hepatocellular carcinoma; hepatotropic; metastatic liver tumour; cytostatic; expression profile; disease state; disease progression; drug toxicity; drug efficacy; drug metabolism.

                                                                                                                                                                                                                                                                                                                               à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides methods and assays for ordering assays which detect single nucleotide polymorphisms (SNPs) or gene expression. It provides to a consumer, assays to detect presence or expression of genetic material, by providing a web-based user interface to receive an order for one or more stock assays, providing a web-based user interface to receive a request for design of one or more custom assays and an order
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

WPI; 2001-281607/29.

Novel diagnostic and therapeutic polynucleotides, used in disease diagnosis and for gene therapy of conditions such as cancer and thalassemia.

Claim 1; Page 274; 299pp; English.

The present sequence for human diagnostic and therapeutic (dithp) cDNA sequence #38 is 1 of 71 (AAS03012-AAS03082) novel sequence 838 is 1 of 71 (AAS03012-AAS03082) novel sequence secreted in the invention. The present sequence (Incyte ID No: 3456996060) encodes a secreted and extracellular molecule. The dithp polynucleotides may be used to identify the presence of similar nucleic acids. Dithp polynucleotides may used to generate hybridisation probes for use in chromosomal mapping. Polypeptides (DITHP) encoded by dithp are used to screen for molecules which bind to them and modulate their used to screen for molecules and the used for gene therapy of disorders such as severe combined immundeficiaency syndrome (SCID), cystic fibrosis, thalassemia, haemophilia resulting from Factor VIII or IX difficancies, cardiovascular disorders e-g familial hypercholesterolaemia (FH), cell proliferative disorders e-g cancers, neurodegenerative disorders e-g cancers, infectious disorders and developmental disorders. The antibodies can be used to analyse protein expression levels

```
The invention relates to an isolated polynucleotide (I) comprising a nucleotide sequence selected from any of 94% sequences (ABZ1119-ABZ1206) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABR68902-ABR66849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cellinaging, screening and diagnostic assays and for treating cellinaging, or Alzheimer's disease), autoimmune diseases (multiple sclerosis, diabetes, lupus) genetic disorders, wound, burns, incision, ulcers, liver or lung fibrosis, infections (bacterial, viral, fungal, parasitic), arthritis, etc. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                  New polynucleotides comprising sequences assembled from expressed sequence tags (ESTS), useful for treating cell-proliferative, neurodegenerative, autonimmune, genetic, myeloid or lymphoid, or platelet or coagulation disorders.
                                                                                             Ren F;

Site 2: Smal; A mini-library was made by cloning products derived from ORESTES PCR (U.S. Letters Patent application No. 196,716 - Ludwig Institute for Cancer Research) profiles into the pUC 18 vector. Reverse transcription of tissue mRNA and cDNA amplification were performed under low stringency conditions."

Patent No. 5466593

GENERAL INFORMATION:
APPLICANT: Takeshi SHIMOMURA et al.
TITLE OF INVENTION: No. 5466593el Protein and Gene Encoding Said Protein
NUMBER OF SEQUENCES: 14
CORRESPONDENCE ADDRESS:
ADDRESSEE: Wenderoth, Lind & Ponack
STREET: 805 Fifteenth Street, N.W., #700
                                                                                                                                                                                                 Sequence
Sequence
                                                                               Sequence
                                                                                                                                                                                                                                                                              Sequence

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description
